Stakeholder Mapping:

1. **Primary Users (Field Agents & Extension Officers):** Require fast, reliable, offline-capable or low-bandwidth search to advise farmers on the spot.
2. **End Beneficiaries (Smallholder Farmers):** Benefit from correct, localized, and timely crop protection strategies.
3. **Content Providers (Agricultural Institutions such as CGIAR/FAO/IITA):** Provide the underlying factsheets; require proper licensing (CC-BY) and source attribution.
4. **Technical Team & System Administrators:** Maintain vector embeddings, re-ranking models, and server infrastructure.

Feedback Loops & Continuous Improvement:

- How field officers rate retrieved answer quality in real-world scenarios.
- Mechanisms to update the 695-document corpus whenever new agronomic guidelines or regional outbreak alerts are published.

Risks & Mitigation:

- **Risk:** Misapplication of advice due to localized climate differences.
- **Mitigation:** Explicit metadata tags (crop, country, source) displayed alongside every retrieved passage so officers know the geographic context.
